TITLE OF INVENTION POLYCARBONATE MOLDING MATERIALS WITH ANTI-STATIC PROPERTIES

APPLICANT(S) FOR DO/EO/US 1) Michael Zobel; 2) Thomas Eckel; 3) Dieter Wittmann; 4) Bernd Keller

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND or SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☒ This is an express request to begin national examination procedures (35 U.S.C. 371(f)). The submission must include items (5), (6), (9) and (21) indicated below.
4. ☒ The US has been elected by the expiration of 19 months from the priority date (Article 31).
5. ☒ A copy of the International Application as filed (35 U.S.C. 371(c)(2))
 - a. ☒ is attached hereto (required only if not communicated by the International Bureau).
 - b. ☐ has been communicated by the International Bureau.
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☒ An English language translation of the International Application as filed (35 U.S.C. 371(c)(2)).
 - a. ☒ is attached hereto.
 - b. ☐ has been previously submitted under 35 U.S.C. 154(d)(4).
7. ☐ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3))
 - a. ☐ are attached hereto (required only if not communicated by the International Bureau).
 - b. ☐ have been communicated by the International Bureau.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☐ have not been made and will not be made.
8. ☐ An English language translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371 (c)(3)).
9. ☐ An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)).
10. ☐ An English language translation of the annexes of the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).

Items 11 to 20 below concern document(s) or information included:

11. ☒ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
12. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
13. ☒ A **FIRST** preliminary amendment.
14. ☐ A **SECOND or SUBSEQUENT** preliminary amendment.
15. ☐ A substitute specification.
16. ☐ A change of power of attorney and/or address letter.
17. ☐ A computer-readable form of the sequence listing in accordance with PCT Rule 13ter.2 and 35 U.S.C. 1.821 - 1.825.
18. ☒ A second copy of the published international application under 35 U.S.C. 154(d)(4).
19. ☐ A second copy of the English language translation of the international application under 35 U.S.C. 154(d)(4).
20. ☒ Other items or information:

PTO Form 1449 and references listed therein; Preliminary Amendment w/Abstract

U.S. APPLICATION NO. (If known, see 37 CFR 1.53)

PRELIMINARY AMENDMENT

Assistant Commissioner for Patents

Washington, D.C. 20231

Sir:

Prior to its examination kindly amend the English language translation of the enclosed application as follows:

"Express Mail" mailing label number ET146886275US

Date of Deposit July 26, 2001

I hereby certify that this paper or fee is being deposited with the United States Postal Service "Express Mail Post Office to Addressee" service under 37 CFR 1.10 on the date indicated above and is addressed to the Assistant Commissioner of Patents and Trademarks, Washington, D.C. 20231

Donna J. Veatch

Signature of person mailing paper or fee)

IN THE SPECIFICATION:

Delete the title of the application - appearing in pages 1 and 23 - and insert therefor:

-- Polycarbonate Molding Materials with Anti-Static Properties --.

IN THE ABSTRACT:

Please revise the Abstract of the Disclosure at page 23 to read:

-- A thermoplastic molding compositions comprising thermoplastic polycarbonate and an additive amount of an aluminum compound is disclosed. The aluminum compound is characterized by its particle size and the composition is characterized by its improved anti-static properties. --

IN THE CLAIMS:

Please amend as follows:

1. A thermoplastic molding composition comprising thermoplastic polycarbonate and 0.01 to 30 parts by wt. of an aluminum compound, said part by wt. being per 100 parts by wt. of polycarbonate said compound having an average particle diameter of 1 nm - 20 μ m.
2. The composition according to Claim 1, characterized in that the average particle diameter of the compound is 1 nm - 10 μ m.
3. The composition according to Claim 1, characterized in that said average particle diameter of the compound is 5 - 500 nm.
4. The composition according to Claim 1, wherein said compound is a member selected from the group consisting of oxides, water-containing oxides, phosphates, sulfates, sulfides, sulfites, hydroxides, borates and borophosphates of aluminium.
5. The composition according to Claim 1 comprising
 - A. 40 to 99 parts by wt. aromatic polycarbonate,

- B. 0 to 50 parts by wt. vinyl copolymer,
- C. 0.5 to 60 parts by wt. graft polymer,
- D. 0.1 to 30 parts by wt. aluminium compound.
6. The composition according to Claim 1, comprising 50 to 95 parts by wt. aromatic polycarbonate [A] .
7. The composition according to Claim 5, wherein graft polymer C is a product of copolymerization of
- 5 to 95 parts by wt. of a mixture of
- 50 to 95 parts by wt. styrene, α -methylstyrene, styrene substituted on the nucleus by halogen or alkyl, C₁-C₈-alkyl methacrylate, C₁-C₈-alkyl acrylate or mixtures of these compounds and
- 5 to 50 parts by wt. acrylonitrile, methacrylonitrile, C₁-C₈-alkyl methacrylate, C₁-C₈-alkyl acrylate, maleic anhydride, C₁-C₄-alkyl or phenyl-N-substituted maleimide or mixtures of these compounds or 5 to 95 parts by weight of a polymer having a glass transition temperature below -10°C.
8. The composition of Claim 1 which further comprises at least one additive selected from the group consisting of stabilizers, pigments, mould release agents, flow auxiliaries and antistatics.
9. The composition of Claim 1 which further comprises at least one additive selected from the group consisting of fillers, reinforcing materials and inorganic compounds.

Figure 1 consists of 48 small diagrams arranged in a 4x12 grid. The diagrams are labeled with letters A, B, C, and D in the first column, and numbers 1 through 12 in the first row. Each diagram shows a cross-section of the hindbrain of a chick embryo at a specific stage of development. The diagrams illustrate the progression of hindbrain development from early stages (1-6) to later stages (7-12). The diagrams are arranged in four rows (A, B, C, D) and twelve columns (1-12). Each diagram shows a cross-section of the hindbrain with various structures labeled. The diagrams illustrate the progression of hindbrain development from early stages (1-6) to later stages (7-12).

IN THE CLAIMS:

Please amend as follows:

1. [Thermoplastic moulding compositions] A thermoplastic molding composition comprising thermoplastic polycarbonate and 0.01 to 30 parts by wt. of an aluminum compound, said part by wt. being per 100 parts by wt. of polycarbonate [aluminium compounds] said compound having an average particle diameter of 1 nm - 20 μ m.
2. [Thermoplastic moulding compositions] The composition according to claim 1, characterized in that the average particle diameter of the [aluminium] compound is 1 nm - 10 μ m.
3. [Thermoplastic moulding compositions] The composition according to claim 1, characterized in that [that] said average particle diameter of the [aluminium] compound is 5 - 500 nm.
4. [Thermoplastic moulding] The composition according to claim 1, [characterized in that it comprises] wherein said compound is a member selected from the group consisting of oxides, water-containing oxides, phosphates, sulfates, sulfides, sulfites, hydroxides, borates [or] and borophosphates of aluminium.
5. [Thermoplastic moulding] The composition according to claim 1 comprising
 - A. 40 to 99 parts by wt. aromatic polycarbonate,
 - B. 0 to 50 parts by wt. vinyl copolymer,
 - C. 0.5 to 60 parts by wt. graft polymer,

- D. 0.1 to 30 parts by wt. aluminium compound.
6. [Moulding compositions] The composition according to claim 1, comprising 50 to 95 parts by wt. aromatic polycarbonate [A] .
7. [Moulding compositions] The composition according to claim 5, [comprising] wherein graft [polymers] polymer C [prepared by] is a product of copolymerization of

5 to 95 parts by wt. of a mixture of

50 to 95 parts by wt. styrene, α -methylstyrene, styrene substituted on the nucleus by halogen or alkyl, C₁-C₈-alkyl methacrylate, C₁-C₈-alkyl acrylate or mixtures of these compounds and

5 to 50 parts by wt. acrylonitrile, methacrylonitrile, C₁-C₈-alkyl methacrylate, C₁-C₈-alkyl acrylate, maleic anhydride, C₁-C₄-alkyl or phenyl-N-substituted maleimide or mixtures of these compounds or 5 to 95 parts by weight of a polymer having a glass transition temperature below -10°C.

8. [Moulding compositions according to any one of claims 1 to 7,] The composition of Claim 1 which further comprise at least one additive selected from the group consisting of stabilizers, pigments, mould release agents, flow auxiliaries [and/or] and antistatics.
9. [Moulding compositions according to any one of claims 1 to 8,] The composition of Claim 1 which further comprise at least one additive selected from the group consisting of fillers [and], reinforcing materials and inorganic compounds.
- Cancel Claims 10 and 11

Please add the following:

- 12. A method of using the molding composition of Claim 1 comprising producing a molded article.
- 13. A molded article prepared by the method of Claim 12. --

Polycarbonate moulding compositions with improved antistatic properties

1 The present invention relates to polycarbonate moulding compositions which
2 comprise aluminium compounds and have improved mechanical properties and an
5 improved antistatic action.

Thermoplastic moulding compositions, in particular those which comprise homo-
and/or copolymers of one or more ethylenically unsaturated monomers,
polycarbonates and polyesters, are known from a large number of publications. This
10 particularly applies to the use of ABS polymers. Reference is made to the following
documents merely by way of example: DE-A-19616, WO 97/40092, EP-A-728811,
EP-A-315868 (= US 4937285), EP-A 0174493 (US 4983658), US 5030675, JA
59202240, EP-A 0363608 (= US 5204394), EP-A 0767204, EP-A 0611798, WO
96/27600 and EP-A 0754.

15 The thermoplastic moulding compositions described in this prior art are still in need
of improvement in their mechanical properties. This particularly applies to the use
of these moulding compositions in safety-relevant components, e.g. in the motor
vehicle industry, where high requirements are imposed on elongation at break, ESC
20 properties, notched impact strength, heat distortion point and processability.

The antistatic action of the known moulding compositions also still requires
improvement.

Surprisingly, it has now been found that polycarbonate moulding compositions have
an antistatic action and improved mechanical properties if aluminium compounds
are added to them.

The invention accordingly provides thermoplastic moulding compositions
comprising thermoplastic polycarbonate and 0.01 to 30, preferably 0.01 - 20,

"Express Mail" mailing label number US 4008062/2001
Date of Deposit July 26, 2001

I hereby certify that this paper or fee is being deposited with the United States
Postal Service "Express Mail Post Office to Addressee" service under 37 CFR
1.10 on the date indicated above and is addressed to the Assistant Commissioner
of Patents and Trademarks, Washington, D.C. 20231

Donna J. Veatch
(Name of person mailing paper or fee)

Signature of person mailing paper or fee)

particularly preferably 0.01 - 10 parts by wt. per 100 parts by wt. (polycarbonate) of aluminium compounds having an average particle diameter of 1 nm - 20 μ m, preferably 1 nm - 10 μ m, particularly preferably 5 - 500 nm and especially preferably 5 - 200 nm.

5

The invention in particular provides thermoplastic moulding compositions comprising

- 10 A. 40 to 99 parts by wt., preferably 50 to 95 parts by wt., particularly preferably 60 to 90 parts by wt. of an aromatic polycarbonate,
- 15 B. 0 to 50, preferably 1 to 30 parts by wt. of a vinyl (co)polymer of at least one monomer chosen from the series consisting of styrene, α -methylstyrene, styrenes substituted on the nucleus, C₁-C₈-alkyl methacrylates and C₁-C₈-alkyl acrylates with at least one monomer from the series consisting of acrylonitrile, methacrylonitrile, C₁-C₈-alkyl methacrylates, C₁-C₈-alkyl acrylates, maleic anhydride and N-substituted maleimides,
- 20 C. 0.5 to 60 parts by wt., preferably 1 to 40 parts by wt., particularly preferably 2 to 30 parts by wt. of a graft polymer comprising at least two monomers from the group consisting of mono- or polyunsaturated olefins, such as e.g. ethylene, propylene, chloroprene, butadiene and isoprene, vinyl acetate, styrene, α -methylstyrene, styrenes substituted on the nucleus, vinyl cyanides, such as e.g. acrylonitrile and methacrylonitrile, maleic anhydride and N-
- 25 substituted maleimides,
- 30 D. 0.01 to 30 parts by wt., preferably 0.01 to 20 parts by wt., particularly preferably 0.01 to 10 parts by wt. of aluminium compounds having an average particle diameter of 1 nm - 20 μ m, preferably 1 nm - 10 μ m, particularly preferably 5 - 500 nm and especially preferably 5 - 200 nm.

The sum of all the parts by weight of A + B + C + D gives 100.

5 Each of the components mentioned can also be used as mixture.

Component A

10 Thermoplastic aromatic polycarbonates according to component A which are suitable according to the invention are those based on diphenols of the formula (I)

wherein

20 A is a single bond, C₁-C₅-alkylene, C₂-C₅-alkylidene, C₅-C₆-cycloalkylidene, -S- or -SO₂-,

B is chlorine or bromine,

25 q is 0, 1 or 2 and

p is 1 or 0,

or alkyl-substituted dihydroxyphenylcycloalkanes of the formula (II)

30

10 wherein

R^7 and R^8 independently of one another each denote hydrogen, halogen, preferably chlorine or bromine, C_1 - C_8 -alkyl, C_5 - C_6 -cycloalkyl, C_6 - C_{10} -aryl, preferably phenyl, and C_7 - C_{12} -aralkyl, preferably phenyl- C_1 - C_4 -alkyl, in particular benzyl,

15

m denotes an integer of 4, 5, 6 or 7, preferably 4 or 5,

R^9 and R^{10} can be chosen individually for each Z and independently of one another denote hydrogen or C_1 - C_6 -alkyl,

20

and

Z denotes carbon, with the proviso that on at least one atom Z R^9 and R^{10} simultaneously denote alkyl.

25

Suitable diphenols of the formula (I) are e.g. hydroquinone, resorcinol, 4,4'-dihydroxydiphenyl, 2,2-bis-(4-hydroxyphenyl)-propane, 2,4-bis-(4-hydroxyphenyl)-2-methylbutane, 1,1-bis-(4-hydroxyphenyl)-cyclohexane, 2,2-bis-(3-chloro-4-hydroxyphenyl)-propane and 2,2-bis-(3,5-dibromo-4-hydroxyphenyl)-propane.

30

Preferred diphenols of the formula (I) are 2,2-bis-(4-hydroxyphenyl)-propane, 2,2-bis-(3,5-dichloro-4-hydroxyphenyl)-propane and 1,1-bis-(4-hydroxyphenyl)-cyclohexane.

Preferred diphenols of the formula (II) are 1,1-bis-(4-hydroxyphenyl)-3,3-dimethyl-cyclohexane, 1,1-bis-(4-hydroxyphenyl)-3,3,5-trimethylcyclohexane and 1,1-bis-(4-hydroxyphenyl)-2,4,4-trimethyl-cyclopentane.

Polycarbonates which are suitable according to the invention are both homopolycarbonates and copolycarbonates.

Component A can also be a mixture of the thermoplastic polycarbonates defined above.

Polycarbonates can be prepared in a known manner from diphenols with phosgene by the phase boundary process or with phosgene by the process in a homogeneous phase, the so-called pyridine process, it being possible for the molecular weight to be adjusted in a known manner by a corresponding amount of known chain stoppers.

Suitable chain stoppers are e.g. phenol, p-chlorophenol, p-tert-butylphenol or 2,4,6-tribromophenol, and also long-chain alkylphenols, such as 4-(1,3-tetramethylbutyl)-phenol, in accordance with DE-OS 2842005, or monoalkylphenols or dialkylphenols having a total of 8 to 20 C atoms in the alkyl substituents, in accordance with German Patent Application P 3506472.2, such as 3,5-di-tert-butylphenol, p-isooctylphenol, p-tert-octylphenol, p-dodecylphenol and 2-(3,5-dimethyl-heptyl)-phenol and 4-(3,5-dimethyl-heptyl)-phenol.

The amount of chain stoppers is in general between 0.5 and 10 mol%, based on the sum of the particular diphenols of the formulae (I) and/or (II) employed.

Polycarbonates A which are suitable according to the invention have average molecular weights (\overline{M}_w , weight-average, measured e.g. by ultracentrifugation or scattered light measurement) of 10,000 to 200,000, preferably 20,000 to 80,000.

Polycarbonates A which are suitable according to the invention can be branched in a known manner, and in particular preferably by incorporation of 0.05 to 2 mol%, based on the sum of the diphenols employed, of compounds which are trifunctional or more than trifunctional, e.g. those having three or more than three phenolic groups.

Preferred polycarbonates are, in addition to bisphenol A homopolycarbonate, the copolycarbonates of bisphenol A with up to 15 mol%, based on the molar sum of diphenols, of 2,2-bis-(3,5-dibromo-4-hydroxyphenyl)-propane and the copolycarbonates of bisphenol A with up to 60 mol%, based on the molar sum of diphenols, of 1,1-bis-(4-hydroxyphenyl)-3,3,5-trimethylcyclohexane.

Polycarbonates A can be replaced in part or completely by aromatic polyester carbonates. The aromatic polycarbonates of component A can also contain polysiloxane blocks. The preparation thereof is described, for example, in DE-OS 3334872 and in US 3821325.

Component B

Vinyl (co)polymers according to component B which can be employed according to the invention are those of at least one monomer from the series consisting of: styrene, α -methylstyrene and/or styrenes substituted on the nucleus, C_1 - C_8 -alkyl methacrylate and C_1 - C_8 -alkyl acrylate with at least one monomer from the series consisting of: acrylonitrile, methacrylonitrile, C_1 - C_8 -alkyl methacrylate, C_1 - C_8 -alkyl acrylate, maleic anhydride and/or N-substituted maleimides (B.2).

C₁-C₈-Alkyl acrylates and C₁-C₈-alkyl methacrylates are esters of acrylic acid and methacrylic acid respectively and monohydric alcohols having 1 to 8 C atoms. Methyl, ethyl and propyl methacrylate are particularly preferred. Methyl methacrylate is mentioned as a particularly preferred methacrylic acid ester.

Thermoplastic (co)polymers having a composition according to component B can be formed as a by-product during the grafting polymerization for the preparation of component C, especially if large amounts of monomers are grafted on to small amounts of rubber. The amount of (co)polymer B to be employed according to the invention does not include these by-products of the grafting polymerization.

(Co)polymers according to component B are resinous, thermoplastic and rubber-free.

Particularly preferred (co)polymers B are those of styrene (B1) with acrylonitrile and optionally with methyl methacrylate (B2), of α -methylstyrene (B1) with acrylonitrile and optionally with methyl methacrylate (B2), or of styrene (B1) and α -methylstyrene with acrylonitrile and optionally with methyl methacrylate (B2).

Thermoplastic (co)polymers B comprise 50 to 99, preferably 60 to 95 parts by wt. B.1 and 50 to 2, preferably 40 to 5 parts by wt. B.2.

The styrene/acrylonitrile copolymers according to component B are known and can be prepared by free-radical polymerization, in particular by emulsion, suspension, solution or bulk polymerization. The copolymers according to component B preferably have molecular weights \overline{M}_w (weight-average, determined by light scattering or sedimentation) of between 15,000 and 200,000.

Particularly preferred copolymers B according to the invention are also randomly built-up copolymers of styrene and maleic anhydride, which can be prepared from

the corresponding monomers by a continuous bulk or solution polymerization with incomplete conversions.

5 The contents of the two components of the randomly built-up styrene/maleic anhydride copolymers which are suitable according to the invention can be varied within wide limits. The preferred content of maleic anhydride is 5 to 25 wt.%.

10 The molecular weights (number-average \overline{M}_n) of the randomly built-up styrene/maleic anhydride copolymers according to component B which are suitable according to the invention can vary over a wide range. The range from 60,000 to 200,000 is preferred. A limiting viscosity of 0.3 to 0.9 (measured in dimethylformamide at 25°C; in this context see Hoffmann, Krömer, Kuhn, Polymeranalytik I, Stuttgart 1977, page 316 et seq.) is preferred for these products.

15 Instead of styrene, vinyl (co)polymers B can also comprise styrenes which are substituted on the nucleus, such as p-methylstyrene, vinyltoluene and 2,4-dimethylstyrene, and other substituted styrenes, such as α -methylstyrene, which can optionally be halogenated.

20 Component C

Graft polymers C comprise e.g. graft copolymers with rubber-elastic properties which are substantially obtainable from at least two of the following monomers: chloroprene, 1,3-butadiene, isoprene, styrene, acrylonitrile, ethylene, propylene,
25 vinyl acetate and (meth)-acrylic acid esters having 1 to 18 C atoms in the alcohol component; that is to say polymers such as are described e.g. in "Methoden der Organischen Chemie" (Houben-Weyl), vol. 14/1, Georg Thieme-Verlag, Stuttgart 1961, p. 393-406 and in C.B. Bucknall, "Toughened Plastics", Appl. Science Publishers, London 1977. Preferred polymers C are partly crosslinked and have gel

contents of more than 20 wt.%, preferably more than 40 wt.%, in particular more than 60 wt.%.

Preferred graft polymers C include graft polymers of:

C.1 5 to 95, preferably 30 to 80 parts by wt. of a mixture of

C.1.1 50 to 95 parts by wt. styrene, α -methylstyrene, styrene substituted on the nucleus by halogen or methyl, C_1 - C_8 -alkyl methacrylate, in particular methyl methacrylate, or C_1 - C_8 -alkyl acrylate, in particular methyl methacrylate, or mixtures of these compounds and

C.1.2 5 to 50 parts by wt. acrylonitrile, methacrylonitrile, C_1 - C_8 -alkyl methacrylate, in particular methyl methacrylate, C_1 - C_8 -alkyl acrylate, in particular methyl acrylate, maleic anhydride or C_1 - C_4 -alkyl- or phenyl-N-substituted maleimides, or mixtures of these compounds, on

C.2 5 to 95, preferably 20 to 70 parts by wt. polymer having a glass transition temperature below -10°C .

Preferred graft polymers C are e.g. polybutadienes, butadiene/styrene copolymers and acrylate rubbers grafted with styrene and/or acrylonitrile and/or (meth)acrylic acid alkyl esters; i.e. copolymers of the type described in DE-OS 1694173 (= US 3564077); and polybutadienes, butadiene/styrene or butadiene/acrylonitrile copolymers, polyisobutenes or polyisoprenes grafted with acrylic or methacrylic acid alkyl esters, vinyl acetate, acrylonitrile, styrene and/or alkylstyrenes, such as are described e.g. in DE-OS 2348377 (= US 3919353).

Particularly preferred polymers C are e.g. ABS polymers, such as are described e.g. in DE-OS 2035390 (= US 3644574) or in DE-OS 2248242 (= GB B 1409275).

Particularly preferred graft polymers C are graft polymers which are obtainable by a grafting reaction of

- 5 I. 10 to 70, preferably 15 to 50, in particular 20 to 40 wt.%, based on the graft product, of at least one (meth)acrylic acid ester or 10 to 70, preferably 15 to 50, in particular 20 to 40 wt.% of a mixture of 10 to 50, preferably 20 to 35 wt.%, based on the mixture, of acrylonitrile or (meth)acrylic acid ester and 50 to 90, preferably 65 to 80 wt.%, based on the mixture, of styrene on
- 10 II. 30 to 90, preferably 50 to 85, in particular 60 to 80 wt.%, based on the graft product, of a butadiene polymer with at least 50 wt.%, based on II, of butadiene radicals as the graft base,
- 15 wherein the gel content of graft base II is preferably at least 20 wt.%, particularly preferably at least 40 wt.% (measured in toluene), the degree of grafting G is 0.15 to 0.55 and the average particle diameter d_{50} of the graft polymer is 0.05 to 2 μm , preferably 0.1 to 0.6 μm .
- 20 (Meth)acrylic acid esters I are esters of acrylic acid or methacrylic acid and monohydric alcohols having 1 to 18 C atoms. Methyl, ethyl and propyl methacrylate are particularly preferred.

In addition to butadiene radicals, graft base II can contain up to 50 wt.%, based on

25 II, of radicals of other ethylenically unsaturated monomers, such as styrene, acrylonitrile, esters of acrylic or methacrylic acid having 1 to 4 C atoms in the alcohol component (such as methyl acrylate, ethyl acrylate, methyl methacrylate and ethyl methacrylate), vinyl esters and/or vinyl ethers. The preferred graft base II comprises pure polybutadiene.

The degree of grafting G designates the weight ratio of grafted-on grafting monomer to graft base and has no dimensions.

The average particle size d_{50} is the diameter above and below which in each case 50 wt.% of the particles lie. It can be determined by means of ultracentrifuge measurement (W. Scholtan, H. Lange, Kolloid, Z. und Z. Polymere 250 (1972), 782-796).

Particularly preferred polymers C are e.g. also graft polymers of

- (a) 20 to 90 wt.%, based on C, of acrylate rubber having a glass transition temperature below -20°C as the graft base and
- (b) 10 to 80 wt.%, based on C, of at least one polymerizable, ethylenically unsaturated monomer (cf. C.1) as the grafting monomer.

The acrylate rubbers (a) of polymers C are preferably polymers of acrylic acid alkyl esters, optionally with up to 40 wt.%, based on (a), of other polymerizable, ethylenically unsaturated monomers. Preferred polymerizable acrylic acid esters include $\text{C}_1\text{-C}_8$ -alkyl esters, for example the methyl, ethyl, butyl, n-octyl and 2-ethylhexyl esters; halogenoalkyl esters, preferably halogeno- $\text{C}_1\text{-C}_8$ -alkyl esters, such as chloroethyl acrylate, and mixtures of these monomers.

For crosslinking, monomers having more than one polymerizable double bond can be copolymerized. Preferred examples of crosslinking monomers are esters of unsaturated monocarboxylic acids having 3 to 8 C atoms and unsaturated monohydric alcohols having 3 to 12 C atoms or saturated polyols having 2 to 4 OH groups and 2 to 20 C atoms, such as e.g. ethylene glycol dimethacrylate and allyl methacrylate; polyunsaturated heterocyclic compounds, such as e.g. trivinyl and

triallyl cyanurate; polyfunctional vinyl compounds, such as di- and trivinylbenzenes; and also triallyl phosphate and diallyl phthalate.

Preferred crosslinking monomers are allyl methacrylate, ethylene glycol dimethacrylate, diallyl phthalate and heterocyclic compounds which contain at least 3 ethylenically unsaturated groups.

Particularly preferred crosslinking monomers are the cyclic monomers triallyl cyanurate, triallyl isocyanurate, trivinyl cyanurate, triacryloylhexahydro-s-triazine and triallylbenzenes.

The amount of crosslinking monomers is preferably 0.02 to 5, in particular 0.05 to 2 wt.%, based on graft base (a).

With cyclic crosslinking monomers having at least 3 ethylenically unsaturated groups, it is advantageous to limit the amount to less than 1 wt.% of graft base (a).

Preferred "other" polymerizable, ethylenically unsaturated monomers which can optionally be used, in addition to the acrylic acid esters, for the preparation of graft base (a) are e.g. acrylonitrile, styrene, α -methylstyrene, acrylamides, vinyl C₁-C₆-alkyl ethers, methyl methacrylate and butadiene. Preferred acrylate rubbers as graft base (a) are emulsion polymers which have a gel content of at least 60 wt.%.

Further suitable graft bases are silicone rubbers with grafting-active positions such as are described in the Offenlegungsschriften DE-OS 3704657, DE-OS 3704655, DE-OS 3631540 and DE-OS 3631539.

The gel content of graft base (a) is determined at 25°C in dimethylformamide (M. Hoffmann, H. Krömer, R. Kuhn, Polymeranalytik I und II, Georg Thieme-Verlag, Stuttgart 1977).

Since as is known the grafting monomers are not necessarily grafted completely on to the graft base during the grafting reaction, according to the invention graft polymers C are also to be understood as those products which are obtained by polymerization of the grafting monomers in the presence of the graft base.

Component D

Compounds of aluminium with one or more metals of main groups 1 to 5 and sub-groups 1 to 8 of the periodic table, preferably main groups 2 to 5 and sub-groups 4 to 8, particularly preferably main groups 3 to 5 and sub-groups 4 to 8, or compounds with the elements oxygen, carbon, nitrogen, hydrogen, sulfur and silicon are suitable as component D.

Oxides, water-containing oxides, phosphates, sulfates, sulfides, hydroxides, borates and borophosphates of aluminium can be employed according to the invention. Aluminium oxide hydroxide, aluminium phosphate and aluminium borate are particularly preferred. Aluminium oxide hydroxide is especially preferred.

According to the invention, the particle size is $\leq 10 \mu\text{m}$, preferably $\leq 5 \mu\text{m}$.

Water-containing compounds such as aluminium oxide hydroxide are preferred.

Particle size and particle diameter always means the average particle diameter d_{50} , determined by ultracentrifuge measurements by the method of W. Scholtan et al. Kolloid-Z. und Z. Polymere 250(1972), p. 782 to 796.

The aluminium compounds can be in the form of powders, pastes, sols, dispersions or suspensions. Powders can be obtained by precipitation from dispersions, sols or suspensions.

The powders can be incorporated into the thermoplastics by conventional processes, for example by direct kneading or extrusion of the constituents of the moulding composition and the very fine-particled inorganic powders. Preferred processes are the preparation of a masterbatch, e.g. in flameproofing additives, other additives, monomers, solvents or in component A, or coprecipitation of dispersions of components B or C with dispersions, suspensions, pastes or sols of the very fine-particled inorganic materials.

The moulding compositions according to the invention can comprise conventional additives, such as very fine-particled inorganic compounds, lubricants and mould release agents, nucleating agents, antistatics, stabilizers, fillers and reinforcing materials and dyestuffs and pigments. The processing auxiliaries are added in the conventional amounts.

The inorganic compounds include compounds of one or more metals of main groups 1 to 5 or sub-groups 1 to 8 of the periodic table, preferably main groups 2 to 5 or sub-groups 4 to 8, particularly preferably main groups 3 to 5 or sub-groups 4 to 8, with the elements oxygen, sulfur, boron, phosphorus, carbon, nitrogen, hydrogen and/or silicon.

Preferred compounds are, for example, oxides, hydroxides, water-containing oxides, sulfates, sulfites, sulfides, carbonates, carbides, nitrates, nitrites, nitrides, borates, silicates, phosphates, hydrides, phosphites or phosphonates.

Preferred very fine-particled inorganic compounds are, for example, TiN, TiO₂, SnO₂, WC, ZnO, ZrO₂, Sb₂O₃, SiO₂, iron oxides, NaSO₄, BaSO₄, vanadium oxides, zinc borate and silicates, such as Al silicates, Mg silicates and one-, two- and three-dimensional silicates. Mixtures and doped compounds can also be used.

Furthermore, these nanoscale particles can also be surface-modified with organic

molecules in order to achieve a better compatibility with the polymers. Hydrophobic or hydrophilic surfaces can be generated in this manner.

The average particle diameters are less than 200 nm, preferably less than 150 nm, in particular 1 to 100 nm.

Particle size and particle diameter always means the average particle diameter d_{50} , determined by ultracentrifuge measurements by the method of W. Scholtan et al. *Kolloid-Z. und Z. Polymere* 250 (1972), p. 782 to 796.

The inorganic compounds can be in the form of powders, pastes, sols, dispersions or suspensions. Powders can be obtained by precipitation from dispersions, sols or suspensions.

The moulding compositions can comprise up to 25 parts by wt. (based on the total moulding composition) of inorganic compounds.

The powders can be incorporated into the thermoplastics by conventional processes, for example by direct kneading or extrusion of the constituents of the moulding composition and the very fine-particled inorganic powders. Preferred processes are the preparation of a masterbatch, e.g. in flameproofing additives, other additives, monomers, solvents or in component A, or coprecipitation of dispersions of components B or C with dispersions, suspensions, pastes or sols of the very fine-particled inorganic materials.

The thermoplastic moulding compositions can comprise inorganic fillers and reinforcing materials, such as glass fibres, optionally cut or ground, glass beads, glass balls, reinforcing material in platelet form, such as kaolin, talc, mica, silicates, quartz, talc, titanium dioxide, wollastonite, mica, carbon fibres or mixtures thereof.

Cut or ground glass fibres are preferably employed as the reinforcing material.

Preferred fillers, which can also have a reinforcing action, are glass beads, mica, silicates, quartz, talc, titanium dioxide and wollastonite.

The moulding compositions with a filler or reinforcing material content can comprise up to 60, preferably 10 to 40 wt.%, based on the moulding composition with a filler or reinforcing material content, of fillers and/or reinforcing substances.

The moulding compositions according to the invention are prepared by mixing the particular constituents in a known manner and subjecting the mixture to melt compounding or melt extrusion at temperatures of 200°C to 300°C in conventional units, such as internal kneaders, extruders and twin-screw extruders, the fluorinated polyolefins preferably being employed in the form of the coagulated mixture already mentioned.

The individual constituents can be mixed in a known manner both successively and simultaneously, and in particular both at about 20°C (room temperature) and at a higher temperature.

The moulding compositions of the present invention can be used for the production of all types of shaped articles. In particular, shaped articles can be produced by injection moulding. Examples of shaped articles which can be produced are: housing components of all types, e.g. for domestic appliances, such as juice presses, coffee machines and mixers, or for office machines, such as computers, printers and monitors, or covering sheets for the building sector and components for the motor vehicle sector. They are moreover employed in the field of electrical engineering, because they have very good electrical properties.

The moulding compositions are particularly suitable for the production of thin-walled mouldings (e.g. data technology housing components), where particularly

high requirements are imposed on the notched impact strength and stress-cracking resistance of the plastics employed.

- Another form of processing is the production of shaped articles by blow moulding or
5 by thermoforming from previously produced sheets or films.

Examples

Component A

- 5 Polycarbonate based on bisphenol A with a relative solution viscosity of 1.252, measured in methylene chloride at 25°C and in a concentration of 0.5 g/100 ml.

Component B

- 10 Styrene/acrylonitrile copolymer with a styrene/acrylonitrile ratio of 72:28 and a limiting viscosity of 0.55 dl/g (measurement in dimethylformamide at 20°C).

Component C

- 15 Graft polymer of 40 parts by wt. styrene and acrylonitrile in a ratio of 73:27 on 60 parts by wt. crosslinked polybutadiene rubber in particle form (average particle diameter $d_{50} = 0.3 \mu\text{m}$), prepared by emulsion polymerization.

Component D

- 20 Pural 200, an aluminium oxide hydroxide (Condea, Hamburg, Germany) is employed as the inorganic compound. The average particle size of the material is approx. 20 - 40 nm.

Preparation and testing of the moulding compositions according to the invention

Components A to D are mixed on a 3 l internal kneader. The shaped articles are produced on an injection moulding machine type Arburg 270E at 260°C.

The tensile E modulus is measured in accordance with the method of ISO 527.

The elongation at break DR is determined in the context of the determination of the tensile E modulus in accordance with the method of ISO 527 on F3 dumbbell bars.

The antistatic action is determined by a dust figure test. For this circular sheets are charged statically with a cotton cloth and then dusted with aluminium powder. The evaluation is visual.

The Vicat B heat distortion point is determined in accordance with DIN 53460.

The composition of the materials tested and the data obtained are summarized in the following table 1.

Table 1

Examples	1	2
	Comparison	
Components: [%]

Patent claims

1. Thermoplastic moulding compositions comprising thermoplastic polycarbonate and 0.01 to 30 parts by wt. per 100 parts by wt. of polycarbonate aluminium compounds having an average particle diameter of 1 nm - 20 μ m.
2. Thermoplastic moulding compositions according to claim 1, characterized in that the average particle diameter of the aluminium compound is 1 nm - 10 μ m.
3. Thermoplastic moulding compositions according to claim 1, characterized in that that average particle diameter of the aluminium compound is 5 - 500 nm.
4. Thermoplastic moulding composition according to claim 1, characterized in that it comprises oxides, water-containing oxides, phosphates, sulfates, sulfides, sulfites, hydroxides, borates or borophosphates of aluminium.
5. Thermoplastic moulding composition according to claim 1 comprising
- A. 40 to 99 parts by wt. aromatic polycarbonate,
- B. 0 to 50 parts by wt. vinyl copolymer,
- C. 0.5 to 60 parts by wt. graft polymer,
- D. 0.1 to 30 parts by wt. aluminium compound.
6. Moulding compositions according to claim 1, comprising 50 to 95 parts by wt. aromatic polycarbonate A.

7. Moulding compositions according to claim 5, comprising graft polymers C prepared by copolymerization of
- 5 to 95 parts by wt. of a mixture of
- 50 to 95 parts by wt. styrene, α -methylstyrene, styrene substituted on the nucleus by halogen or alkyl, C₁-C₈-alkyl methacrylate, C₁-C₈-alkyl acrylate or mixtures of these compounds and
- 5 to 50 parts by wt. acrylonitrile, methacrylonitrile, C₁-C₈-alkyl methacrylate, C₁-C₈-alkyl acrylate, maleic anhydride, C₁-C₄-alkyl or phenyl-N-substituted maleimide or mixtures of these compounds.
8. Moulding compositions according to any one of claims 1 to 7, which comprise at least one additive from the group consisting of stabilizers, pigments, mould release agents, flow auxiliaries and/or antistatics.
9. Moulding compositions according to any one of claims 1 to 8, which comprise at least one additive from the group consisting of fillers and reinforcing materials and inorganic compounds.
10. Use of the moulding compositions according to any one of the preceding claims for the production of shaped articles.
11. Shaped articles produced from moulding compositions according to any one of the preceding claims.

Polycarbonate moulding compositions with improved antistatic properties

Abstract

The present invention relates to thermoplastic moulding compositions comprising thermoplastic polycarbonate and 0.01 to 30 parts by wt. per 100 parts by wt. (polycarbonate) of aluminium compounds having an average particle diameter of 1 nm - 20 μ m, preferably 1 nm - 10 μ m particularly preferably 5 - 500 nm.

**COMBINED DECLARATION AND POWER OF ATTORNEY**

ATTORNEY DOCKET NO

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name. I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought

on the invention entitled

POLYCARBONATE MOULDING MATERIALS WITH ANTI-STATIC PROPERTIES

the specification of which is attached hereto,

or was filed on **January 24, 2000**

as a PCT Application Serial No. **PCT/EP00/00515**

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims.

I acknowledge the duty to disclose information which is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, §1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

Prior Foreign Application(s), the priority(ies) of which is/are to be claimed:
